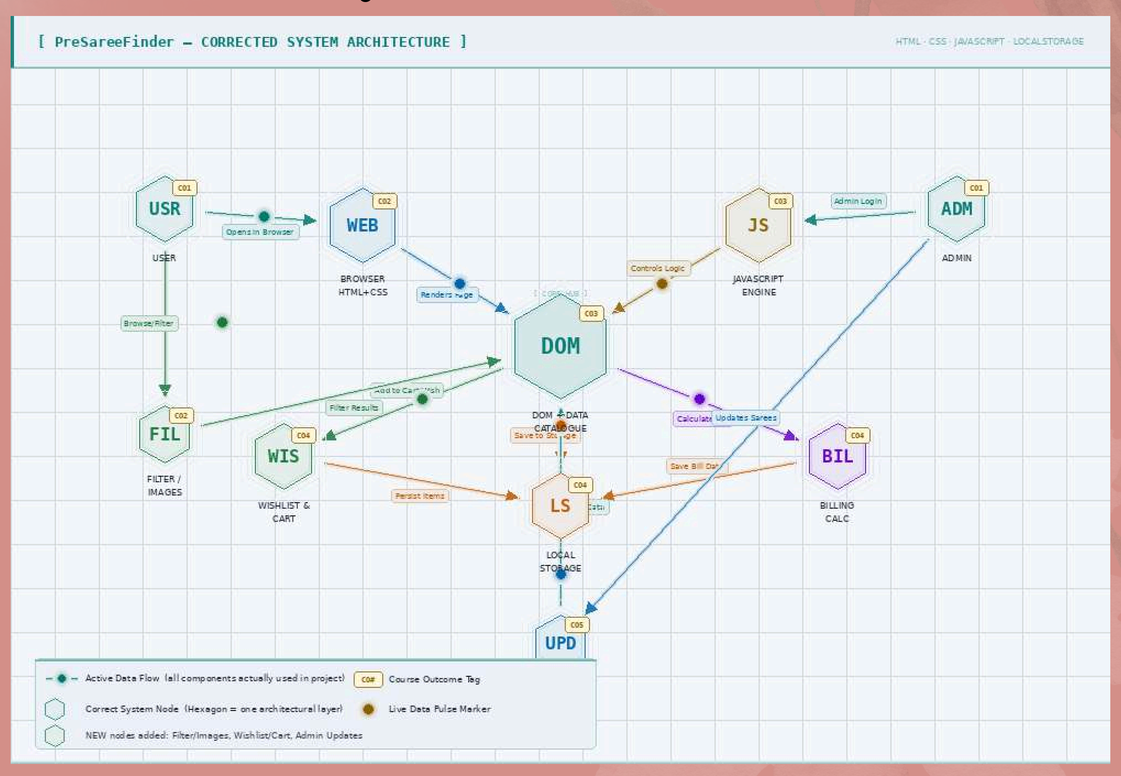
PreSareeFinder – Budget-Based Saree Discovery Platform for Hyderabad

Project Based Learning From FWD

Abstract

PreSareeFinder is a platform that helps users explore saree collections from Hyderabad stores before visiting shopping malls. Customers can browse sarees based on budget and style such as silk, cotton, or designer sarees, save favourites, add items to cart, and view billing details. Store admins can add new sarees, update prices, and manage stock. The project combines Front-End Web Development and Data Structures & Algorithms, using HTML, CSS, JavaScript, and local Storage for the interface and data handling, while searching, sorting, and data structures are used to efficiently manage saree information.

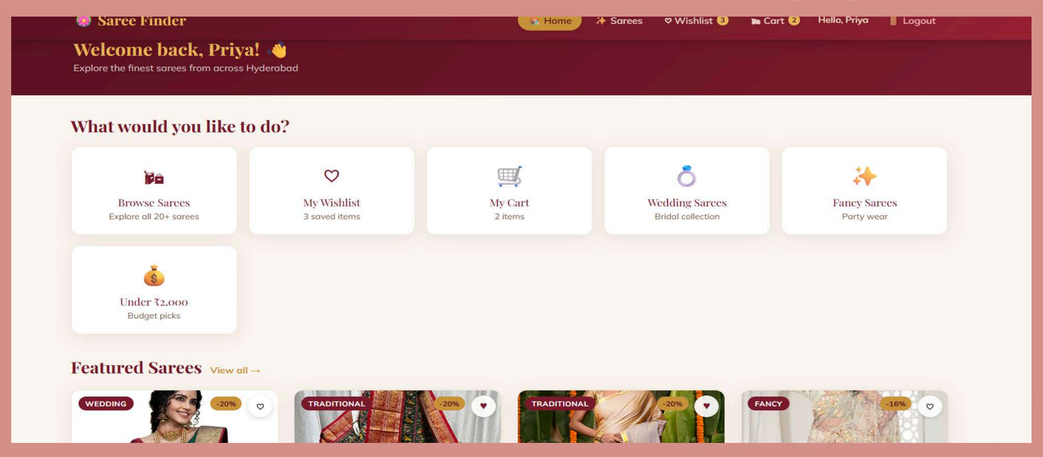
System Architecture



CO - WISE IMPLEMENTATION

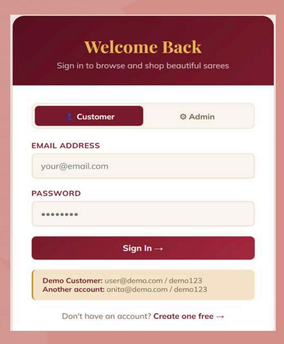
CO1: Algorithm Analysis and Complexity

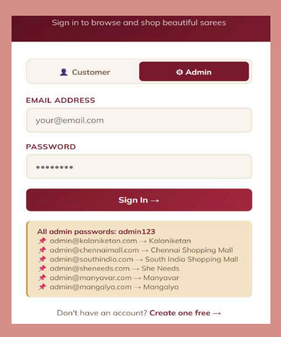
Developed a multi-page web application using HTML5, CSS3 and JavaScript



CO2 – HTML Forms & Input Handling

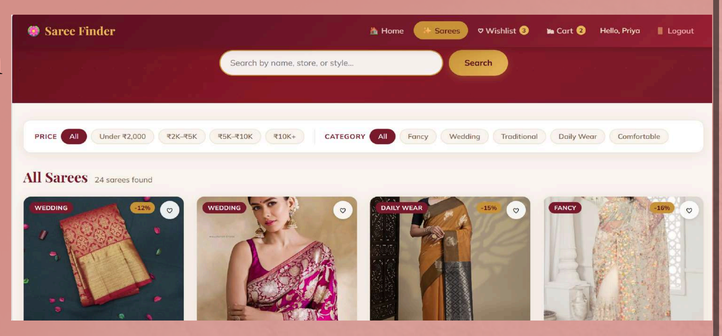
Implemented role-based login system for customers and store admins





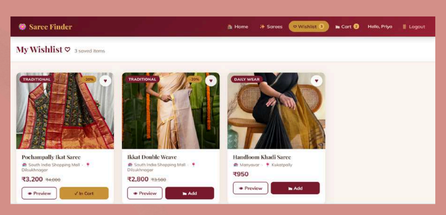
CO3 – JavaScript Programming Essentials

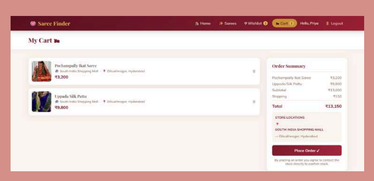
Built saree browsing with search, filter and modal detail view



CO4 – JavaScript Interactivity, DOM & Events

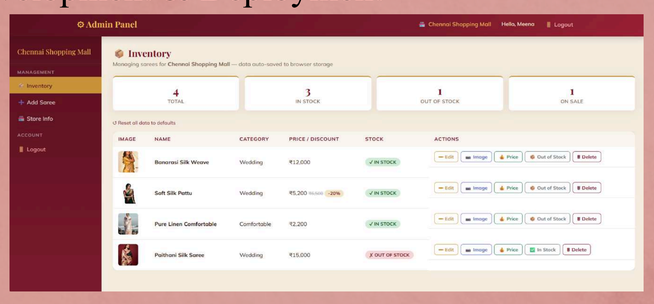
Implemented wish-list and cart using local Storage for persistence





CO5 – Advanced Web Development & Deployment

Implemented admin CRUD operations with store-specific access control



Conclusion and Future Scope:

- PreSareeFinder successfully provides a simple platform for users to browse, search, and manage sarees from multiple Hyderabad stores while allowing admins to update and control store inventory through an easy-to-use web interface.
- Future Scope: The system can be enhanced by integrating a backend database for better data management and expanding the platform to connect saree stores from various cities and locations.
